Biodigital Convergence and the Challenge to Free Will.
Autonomous and Surgery-free Brain Implant
Electronic chips that travel through the body fluids to autonomously implant in target brain regions
iminate surgery risks and costs
at diseases resistant to drugs
Brain-Computer Symbiosis

GBUS #English – Biodigital Convergence and the Challenge to Free Will: A Critical Analysis by Dr. Geanina Hagima.

In this presentation, Dr. Geanina Hagima conducts an exhaustive analysis of what she terms a "global attack on human rights" and the integrity of the human species. The content is broken

down into the following fundamental pillars:

- Denunciation of Undeclared Components: The doctor refers to findings by independent researchers (citing Lorena Diblasi and Marcela Sangorrín) regarding the presence of up to 55 undeclared elements in recent vaccination technologies. She contends that the use of nanotechnology and artificial intelligence in these products lacked the necessary regulation at the time of their implementation.
- Cognitive Warfare and Neurotechnology: She presents the thesis that humanity is in the midst of a “cognitive war” that manipulates the subconscious through technological means. She explains how environmental particles and medical procedures could facilitate nanoparticles crossing the blood-brain barrier via the olfactory nerve, directly affecting neurological functions.
- The Transhumanism Agenda: She links the objectives of Agenda 2030 with biodigital convergence, a process that seeks to transform the human being into a “transhuman” entity through the integration of biotechnology and information technology. She criticizes the visions of theorists like Ray Kurzweil, defending the perfection of natural creation against artificial "human enhancement."
- Brain-Computer Interfaces (BCI): She warns about recent scientific publications presenting non-invasive interfaces capable of stimulating specific neuronal groups. According to her analysis, although presented as solutions for psychiatric diseases, these tools could be used for the remote control of the human mind.
- Call to Action and Legislation: She concludes by emphasizing the urgency of creating legal frameworks that protect free will. She urges the medical community to investigate not only superficial biological effects but also the toxicology of new technologies, exhorting the population to inform themselves to defend the future of coming generations.

The attached video shows a "new technology" developed by MIT (Massachusetts Institute of Technology) called "circulatronics," which consists of sub-cellular scale electronic devices that can be injected via a common syringe into the bloodstream. These autonomous microchips travelly through the blood vessels until they reach specific regions of the brain, where they stop to act as implants without the need for open-skull surgery. Once positioned, they allow for wireless electrical stimulation to treat neurological disorders, eliminating the risks and high costs associated with invasive surgeries.

At the end of the video, we can see a microscopic analysis of the Pfizer Covid vaccine conducted in 2022 by Ricardo Delgado, where graphene-based artificial structures are

observed that should not be present in the injectable.

The images speak for themselves. This technology was implanted without consent and through betrayal in 2020.

About:

> **Mpower Translations** is made up of independent individuals from around the world.
> Our sole purpose is to provide you with the most accurate information that others are trying to hide.
> We translate videos and documents that reveal the reality of what is happening around us, so you can be prepared for the times we are all facing. **We are anti-globalization and pro-human.**
> Our team will translate the videos and documents that everyone needs to know.
> **The survival of our species is at stake.**
